Data Sheet

OPGW-DAB 96E9 (AA/ACS 0/99)

Cross Section

Cable Design

Central-Element: 7,4 mm filled Aluminum Tube
1st Layer: 9 x 3,75 mm Aluminum Clad Steel Wire (Right Hand Lay)

Technical Characteristics

Cable Breaking Load (CBL) 128 kN
Diameter (approx.) 14,9 mm
Weight of Cable (approx.) 760 kg/km
Modulus of Elasticity 162 kN/mm²
Metallic Cross Section (AA-wire+Al-tube / ACS-wire) 25 / 99 mm²
Total Metallic Cross Section 124 mm²
Iₚ (T initial = 20°C) calculated with 10 kA / 1 sec 100 kA²s

DC Resistance (T = 20°C) 0,500 Ohm/km
Coefficient of Linear Expansion 13,0 10⁻⁵/K
Bending Radius; During Installation / After Installation > 300 / > 225 mm
Standard Delivery Length 3 - 5 km
Temperature Range for Installation -30 to +50 °C
Temperature Range for Transportation and Operation -40 to +80 °C

Max. Attenuation SMF E9 at 1310 nm / at 1550 nm 0,36 / 0,2 dB/km
Max. Dispersion SMF E9; 1288 nm to 1339 nm / at 1550 nm 3,5 / 18 ps/(nm·km)
Fiber Standard: SMF E9 fibers according to ITU-T G.652.D

**Armoring: Single Layer Armoring**

A single layer of armoring wires is stranded around an aluminum central buffer tube. The specific wire materials are given in the enclosed cross section drawing. This design provides excellent lightning protection under mechanical load and prevents the fiber from thermal stress under fault current conditions.

Before stranding the wires are pre-formed. This allows the wires to remain in position, even when the cable is cut. Thus simple cable termination and field operations are ensured. The standard lay direction of the outer armoring is right-hand lay, left-hand lay is available on request.

**Optical Unit: Aluminum Central Buffer Tube**

A hermetically sealed optical unit is formed by a central aluminum buffer tube. Fibers are enclosed in the tube with a defined excess length in order to ensure a suitable operating window. This means, even if a tensile load is applied to the cable causing cable elongation, there will be no fiber strain and no increase in fiber attenuation.

Central Buffer Technology provides excellent thermal and mechanical protection of the fibers. The tube is filled with a water blocking filling compound in order to avoid water penetration and migration.

As a result, the optical fibers will not be affected by external influences.

**Fiber Identification: Groups of Bundled Fibers**

The fibers are colored with UV-cured ink. 12 different colors according to TIA/EIA-598 ("Tolcordia Code") are available. Customized coloring is available on request. The central buffer tube contains 96 fibers.

To allow identification, the fibers are divided in 8 groups of 12 fibers.

These groups are held together by colored binders. The following color code is used:
